ABSTRACT

In Ayurvedic classics Mootraghata gives the symptoms of low urine out- put either by retention, absolute. Mootraghata is predominantly due to vata dosha. The vata dosha is responsible to expel the urine out timely and uniformly. Symptom of BPH is almost similar to Mootraghata. Benign prostate hyperplasia (BPH) is one of the most important age associated medical condition have a relatively high socioeconomic burden. In BPH is worsening ability to pass urine in men due to obstruction in urine pathway by the enlargement of size of prostate. Increase size of prostate because differentiation and proliferation of epithelial and stromal compartment of gland, androgen plays important role for these changes. Management of present available surgical and minimal invasive methods have their own limitation. Hence, to find out a suitable Ayurvedic approach for the management of BPH. Varunshigru Ghanvati and Trikantakadya Ghrita is non-inventive and non-surgical therapy for mootraghata. This formulation also provided non hormonal alternative therapy to the BPH patient without any adverse effect.

Keywords: Mootraghata, BPH, Ghanvati

INTRODUCTION

Acharya Sushruta, the pioneer of Shalya tantra has enumerated the urology in his legendary text book of surgery, Sushruta Samhita by describing anatomy, physiology and pathology of many diseases related to urinary system like Ashmarree (urinary stone)1, mootrakricha (painful urination)2, Mootraghata3 (suppuration of obstruction of urine flow), etc. with their management along with diseases of other system. Mootraghata means low urine output due to obstruction in passage of urine. The twelve types of Mootraghata4 reflect the symptom of retention, incomplete voiding, dribbling, hesitancy, incontinence, of urine etc. These are basically presented the feature of lower urinary tract symptom and can be correlate with Benign Prostate Hyperplasia in modern parlance. BPH is fibromyoedema or benign enlargement of glandular part of prostate. Findings of per rectal digital examination5 such as Vritta Granthi (round/oval shaped mass), Shhira-Ghana-Asheela Vata Granthi (hard/firm in consistency), and Unnata Granthi (convex surface), which are found in Vatashheela (prostate enlargement) and Mootragranthi (urinary cyst). Hence, these types of Mootraghata may be related to be more nearer to the disease of BPH. As per the etio-pathogenesis of mootraghata, mootravaha srotodushi (disturbance in urinary system) and vitiation of vata (aapan vata(one type of vata dosha)) are involved6. So vata shamaka (reduce the vata) drug uses in the treatment of mootraghata. Varunshigru Ghan vati along with Trikantakadya Ghrita may helpful in reducing Symptom of mootraghata (BPH) and enhancing the tonicity of urinary bladder. Considering these property Varunshigru ghana vati and Trikantakadya ghrita gave best result in the management of Mootraghata.

Definition
Mootraghata comprise two words- “mooraa + aghata” which stand for low urine output due to obstruction in passage of urine
Mootraghata is characterized by vibandha (obstruction) is dominant feature7. This condition is characterized by drying up or retention of urine8. Benign Prostate Hyperplasia – benign enlargement of prostate gland, with excessive growth of prostatic nodule.

Nidana (Cause)
1. Ativyayama –excessive exercise
2. Teeksha aushadha –drugs of strong potency9
3. Rukshanadaya praasanga–excessive indulgence in dry alcohol
4. Nityadrutaprishtayaanat–riding on the back of fast moving animals regularly
5. Anupamatsya –ingestion of flesh of wet land creatures
6. Adhyashana –eating before digestion of previous meal
7. Ajeerna–indigestion

Epidemiology

The overall incidence rate of BPH is 15 per 1000 men per year. The incidence of BPH is at least 50 % for all men at the age of 50 years and above.
In India BPH is a common pathological condition with an incidence of 92.9710
Recent survey of BPH is as high as 50% at the age of 60 years and 90% at the age of 85 years. It observes that among the men above 80 years, 90% show histological evidence of BPH, out of 81% have BPH related symptoms and 10% suffer from urine retention11.

170
Samprapti (Pathology)

Etiopathogenesis of Mootraghata is concern, there is deranged function of apana vayu (one type of vata) along with the vitiation of kapha and pitta produce ama, which is ultimately cause of shroto-avrodha (obstruction in system). The vitiated dosha travel through sukhsma srotasa (small channels) and finally lodge in basti (bladder), where upon further vitiation of apan vayu (one type of vata) leads to mootraghata (BPH).

Samprapti Ghataka12 (factors involve in pathology)-

<table>
<thead>
<tr>
<th>Dosha</th>
<th>Vata (Apana) predominant Tridosha</th>
</tr>
</thead>
<tbody>

Factors13

Men with the following factors are more likely to develop benign prostatic hyperplasia:
- Age 40 years and older
- Family history of benign prostatic hyperplasia
- Medical conditions such as obesity, heart and circulatory disease, and type 2 diabetes
- Lack of physical exercise
- Erectile dysfunction

Symptoms

Symptoms are divided in two categories on basis of pathology-

<table>
<thead>
<tr>
<th>Obstructive</th>
<th>Irritative</th>
</tr>

<td>Nocturnal incontinence</td>
</tr>
<tr>
<td>Prolong urination</td>
<td>Dyssuria</td>
</tr>
<tr>
<td>Retention of urine14</td>
<td></td>
</tr>
</tbody>
</table>

Treatment

In modern medicine the management of BPH is either by conservative treatment using drugs (e.g. hormonal therapy, chemotherapy etc.) or through a surgical approach (e.g. open Prostatectomy, transurethral resection of prostate-TURP, cryotherapy, etc.). In surgery there have many complications so Ayurvedic remedies better option to cure the diseases without complication.

Drug Profile

Varunashigru Ghana Vati15

DISCUSSION

In Ayurveda, Acharya’s have explained in detail about the management of Mootraghata (BPH) with various treatment modalities. “Varunshigru ghan vati with Trikantakadya ghrita” significant over the symptom with worthwhile results. Under Varunshigru ghan vati Acharya Sarangdhara mentioned two drugs. Varun and shigru having lekhana (scrapping), vata kapha shamaka (equilibrium in vata & kapha), shoshana(absorption), vishaya etc. Property which help to treat the benign prostate hyperplasia. And also, Acharya Chakradutta described Trikantakadya ghrita, having mutral (diuretic), vatakapha nashaka, basti shodhaka (clearing of bladder) properties. As per combined drug formulation therapy is concerned, it is concluded that the Varunshigru ghan vati and Trikantakadya ghrita taken orally and work as:

- a). Diuretic
- b). Improve urine flow
- c). Relax smooth muscle of prostate and internal urethral sphincter
- d). Anti inflammatory, Anti proliferative
- e). Anti estrogenic, anti androgenic

Hence, “Varunshigru ghan vati with Trikantakadya ghrita” will give better result in Mootraghata (BPH).

CONCLUSION

Mootraghata means obstruction of urine flow. Symptom of Mootraghata, and per rectal digital examination finding are nearer to symptom of BPH. BPH is fibromyoadenoma or benign enlargement of glandular part of prostate[25]. In modern medicine, BPH treated either by conservative treatment like hormonal therapy, or prostastic slents, laser ablation, surgical approach. In case of hormonal therapy, laser therapy there are many complications like loss of libido, impotence, gynaecomastia and also very costly. In senile age during and after surgery, arise many complications like postoperative morbidity, decay prostate, recurrent infection, bladder change, impotence, retrograde ejaculation. So Ayurvedic approach i.e. Varun shigru ghan vati and Trikantakadya ghrita are clinically safe, effective & it’s better option to treat Mootraghata (BPH) & beneficial for old age.
