EVALUATION OF ANTI-ULCER ACTIVITY OF METHANOLIC EXTRACT OF
ANOGIESSUS LATIFOLIA LEAVES IN ALBINO RATS

ABSTRACT
Anogeissus latifolia (Roxb. ex DC.) Wall. ex Guill. & Perr. (Combretaceae) has been reported to be used in the treatment of various disorders including stomach and skin diseases. We studied the antiulcer potential of the methanolic extract in order to validate ethnomedical claims regarding the plant use in the above-mentioned disorders. Gastroprotective potential of the methanolic extract of Anogeissus latifolia (ALE) (200 and 400 mg/kg/body weight) was studied on aspirin, and ethanol-induced ulcers. The results of the present study showed for the first time that the ALE possessed gastroprotective activity as evidenced by its significant inhibition in the formation of ulcers induced by chemical agents with a maximum of 88.95%. The parameters studied were ulcer index, gastric juice volume, pH, free acidity and total acidity. These findings could justify, at least partially, the inclusion of this plant in the management of gastric disorders in traditional medicine.

KEY WORDS: Anogeissus latifolia, gastric lesions, helicobacter pylori, balki, unani medicine.

INTRODUCTION
Medicine of plant origin is based upon the premise that plants contain natural substances that can promote health and alleviate illness\(^1\). Anogeissus latifolia (Roxb. ex. Dc), wall. ex. Guill & perr. (Combretaceae) is a medium to large sized tree distributed throughout India in dry deciduous forests and in the subhimalayan region and hills of South India up to 1300 materials. Its common names are axle wood (English), balki, dhawa (Hindi). The plant has been already used in the Ayurveda system of medicine.

Ethnobotanically, the bark and leaves of Anogeissus latifolia has been extensively utilized in the treatment of various disorders like skin disease\(^2\), Snake and Scorpio bite, stomach diseases\(^3\),colic, cough and diarrhea, hepatoprotective\(^4\), antioxidant potential studies, wound healing. Leaf of this plant is rich in galloattannins\(^5\), the leaves have reported as anthelmintic activity\(^6\) and gum has been reported as hypolipidemic activity\(^7\). Gastric ulcer is among the major disease of GIT, for which a large number of traditional and modern medicines are being utilized. Among these, the medicines of plant origin are more popular because of their less adverse effect\(^8\). Previously, no scientific work has been reported on the anti-ulcerogenic activity of this plant leaves. The present study was designed to verify the claims of traditional and use in unani system of medicine. In this study, various parameters like ulcer index, gastric juice volume, pH, free acidity and total acidity were determined.

MATERIALS AND METHODS
Collection of plant
The fresh leaves of Anogeissus latifolia were collected in the month of September -2010 from forest area of Rajamandry district, Andhrapradesh, India, and authenticated by Prof. P Jayaraman, Ph.D., Plant Anatomy Research Centre, Chennai, Tamil Nadu (Reg.No: PARC/2011/748). The voucher specimen was deposited at the department for future reference.

Extraction of plant material
Leaves were dry in shade and grinded in to coarse powder, and sieved through #40 meshes. About 400g of air dried powder was taken in 1000ml soxhlet apparatus and extracted with petroleum ether for 2 days. At the end of second day the powder was taken out and it was dried. After drying it was again packed and extracted by using methanol as solvent, till colour disappeared. The
temperature was maintained at 55ºC-65ºC. After that, the extract was concentrated by distillation and solvent was recovered. The final solution was evaporated to dryness and dry residue was obtained.

**Animals**

Male Albino rats both sex, weighing 150-200g were used. The experimental protocols were approved by institutional Animal Ethical Committee & a written permission from in house ethical committee has been taken to carry out (Reference no. JKKMMRFCP/2010/009) and complete this study.

**EXPERIMENTAL PROCEDURE**

**Acute Oral Toxicity Study**

Animals (Albino rats, 150-200gm) were selected for studies. The procedure was followed by using OECD guidelines 423 (Acute toxic class method).

**Preliminary phytochemical analysis**

The preliminary phytochemical analysis carried to find the phytoconsituents present in the crude extracts.

**Ethanol induced ulcer**

Male Albino rats were divided into six groups of six animals per group and animals were fasted for 24 hrs prior to the experiment in perforated steel cages to avoid coprophagy. Six groups were made as below

- Group I - animals served as normal controls.
- Group II - received 1% CMC (1.0ml/kg p.o) as vehicle control.
- Group III - received 200mg/kg, p.o methanolic extract of *Anogeissus latifolia* leaves.
- Group IV - received 400mg/kg, p.o methanolic extract of *Anogeissus latifolia* leaves.
- Group V - received 100mg/kg, p.o sucralfate as standard.
- One hour after the drug treatment the animals were treated with Aspirin [200mg/kg] to induce ulcers. The stomach was opened and percentage inhibition was calculated.

**Statistical Analysis**

All the values are expressed as mean ± S.E.M for groups of six animals each. Analyzed by one way ANOVA and compared by using Tukey- Kramer multiple comparison tests.

**RESULTS AND DISCUSSION**

**Phytochemical analysis**

The preliminary phytochemical analysis of the extract of *Anogeissus latifolia* leaves showed the presence of flavonoids, tannins, saponins, alkaloids, terpenoids and flavonoids. The results of photochemical screening are given in Table 1.

**Acute toxicity test**

The LD<sub>50</sub> estimated to be greater than 2000 mg/kg. Hence, the biological dose fixed 200mg/kg and 400mg/kg for the extract.

**Ethanol induced ulcer**

Effects of methanolic extract of *Anogeissus latifolia* wall on ulcer index induced by ethanol in rats are shown in Table 2.

Ethanol induced gastric damage showed gross mucosal lesion, including long hemorrhage bands and petechial lesion. Animals pretreated with methanolic extract of *Anogeissus latifolia* wall showed very mild lesions and sometimes no lesion at all, when compared to ulcer control group.

---

Ulcer index (UI) and acid parameters
Oral administration of methanolic extract of Anogeissus latifolia at doses of 200 and 400mg/kg exhibited dose dependent inhibition percentage of 74.18and 80.40 (p<0.05), (p<0.001) respectively compared to the ulcer control, proving the anti ulcer activity. The standard drug Sucralfate (100mg/kg) exhibited percentage inhibition of 88.95.

Aspirin induced ulcer model
Effects of methanolic extract of Anogeissus latifolia wall on ulcer index induced by aspirin in rats are shown in Table 3 and its effect on acid parameters are shown in Table-4.

Ulcer index (UI) and acid parameters
Oral administration of methanolic extract of Anogeissus latifolia wall at doses of 200 and 400mg/kg exhibited dose dependent inhibition percentage of 50.90 and 71.43 (p<0.001) respectively compared to the ulcer control, proving the anti ulcer activity. The standard drug Omeprazole (20mg/kg) exhibited percentage inhibition of 84.86.

The effects of methanolic extract of Anogeissus latifolia wall on acid parameters were less significant at 200mg/kg dose. Methanolic extract of Anogeissus latifolia wall showed significant (p<0.001) effect at 400mg/kg dose compared to ulcer control animals. The volume of acid secretion, total and free acidity was decreased and pH of the gastric juice was increased compared to ulcer control group. But, in this gastric environment also able to induce ulcer, so it can be thought that the antisecretory activity might not be the main mechanism of action of these extracts.

Macroscopical Evaluation
Macroscopical changes of ethanol induced models were shown in figure 1, 2, 3, and 4.

CONCLUSION
The methanolic extract of leaf, showed the presence flavonoids and their glycosides, tannins, triterpenoids. These phytoconstituents present in the extract could be the possible agents involved in the prevention of gastric lesions induced by (chemical agents) aspirin and ethanol.
